Water Softener Regeneration Effluent and Cesspits, Septic Tanks and other Sewage Treatment Systems.

There is much confusion about the effect of water softener regeneration effluent on sewage systems.

The regeneration effluent from a water softener does not contain salt as is popularly believed. It contains mainly calcium chloride. And the softened water contains principally sodium bicarbonate. Both are natural minerals found in drinking water. When the regeneration effluent is diluted with the softened water, it is basically drinking water quality and would meet the Drinking Water Quality Regulations. It cannot and does not materially affect the operation of a sewage system.

Water softeners are often blamed for malfunctioning of a sewage system either through ignorance or as a scapegoat.

Harvey Water Softeners guarantees that our water softener will not adversely affect the efficacy of your sewage system.

Yours faithfully

Harvey Bowden.
